“One man’s rubbish, another man’s treasure”

The average life of a commercial office fit-out being only 5 years, we end up with a large amount of imported virgin plastic components going directly to our landfills.

Why do we not use a valuable resource that is available in abundance right here, instead?

High-density polyethylene is a pliable, yet durable material that is chemically inert.

This resin offers the right amount of flexibility for soft wiring management applications, such as our ZERO umbilical.

HDPE is found in household container products, including milk and juice bottles, hair and beauty products bottles.

K.I.D can offer a collection bin, that lives in the office space. HDPE products can be deposited there and collected to manufacture locally, your new ZERO umbilicals in time for relocation.

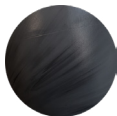

Composition: links are made in Sydney entirely from post-consumer plastics collected and donated, threaded with steel tension wire.

Specifications

- Links are manufactured from client provided or locally collected recycled polypropylene.
- Plastic collection box is available to be delivered and collected from client.
- Tension wire suspension from ceiling or tabletop.
- Length flexibility.
- Charcoal or light gray color options, with client specific finish available on request.
- Cable bend radius restricted.
- CAT6 16 + capacity per cavity.
